Abstract

The usage of accurate crisis data is crucial towards timely, fair and efficient allocation of resources for humanitarian aid. Despite more demand and necessity for such data, funding remains fragmented, intransparent and sometimes redundant. Relying on the first ever collection of crisis data funding information, this paper aims to outline the current state of the crisis data ecosystem, its funding and shortfalls.

1 Introduction

TODO: Motivate the analysis of the crisis data funding ecosystem, state the research question(s), and summarize the contribution.

2 Related Work

TODO: Position this work relative to prior literature. Example citation: Author (2024).

3 Data and Methods

3.1 Data Source

The dataset is exported from the Crisis Data Funding Compass, maintained by the Complex Risk Analytics Fund (CRAF'd, <https://crafd.io>). It comprises two tables: organizations (providers of crisis data products/services) and assets (specific data products/projects), including supporting donors and investment types/themes. See data/README.md in the code repository for the full data dictionary and provenance notes.

3.2 Preprocessing

TODO: Describe cleaning steps (e.g., splitting semicolon-delimited multi-value fields, handling missing values, entity resolution across organizations/donors).

3.3 Analysis

TODO: Describe the analytical/statistical/network methods applied (see `analysis/` in the code repository).

4 Results

TODO: Present findings, referencing figures/tables generated in `results/`.

5 Discussion

TODO: Interpret results, discuss limitations and implications.

6 Conclusion

TODO: Summarize contributions and suggest future work.

References

Author, Example (2024). *An Example Reference*. Replace with real citations.

A Additional Details

TODO: Supplementary tables, robustness checks, or extended data descriptions.
